I had an idea, instead of specifically describing a type of movie one is looking for, they can explain what they are feeling or the mood they are in currently, with that certain movies can be recommended based on their mood or feelings.

Initially I tried to find a dataset for movies, but then my PC was out of storage, so I had to resort to using API. Initially I used Collab but the front end was not displaying properly so I ended up using Flask with html templates. With that in mind with the help of deepseek recommendations I got to work,

In terms of prompts, what worked well was starting broad but there was too much to work with so with each feedback I adjusted to my specifications, deepseek gave me solid code foundation from there I worked around it, made necessary changes. I tried to not rely on it too much though with time constraints I had to make due.

Should I have more time on this project, I would rely less on the help of AI as it did most of the heavy lifting.
